- [Install Dashboard](#)
 - [Access the Dashboard by using the API proxy](#)
 - [Access the Dashboard using port forwarding](#)
 - [Sign in to the Dashboard](#)
- [Install Sample Pod](#)
- [Troubleshooting](#)
 - [Reset and start all over](#)
- [References](#)

Install Kubernetes

```
> sudo apt-get update
> sudo apt-get install -y docker.io
```

Install Curl

```
> sudo apt-get install -y apt-transport-https curl
```

Install Kubernetes

```
curl -s https://packages.cloud.google.com/apt/doc/apt-key.gpg | sudo apt-key add -
echo "deb https://apt.kubernetes.io/ kubernetes-xenial main" | sudo tee -a /etc/apt/sources.list.d/kubernetes.
list
sudo apt-get update
sudo apt-get install -y kubect1 kubelet kubeadm
sudo apt-mark hold kubelet kubeadm kubect1
```

Pull images

```
> sudo kubeadm config images pull
```

```
[config/images] Pulled k8s.gcr.io/kube-apiserver:v1.13.1
[config/images] Pulled k8s.gcr.io/kube-controller-manager:v1.13.1
[config/images] Pulled k8s.gcr.io/kube-scheduler:v1.13.1
[config/images] Pulled k8s.gcr.io/kube-proxy:v1.13.1
[config/images] Pulled k8s.gcr.io/pause:3.1
[config/images] Pulled k8s.gcr.io/etcd:3.2.24
[config/images] Pulled k8s.gcr.io/coredns:1.2.6
```

Disable SWAP

```
> swapoff -va
> vi /etc/fstab
```

```

# /etc/fstab: static file system information.
#
# Use 'blkid' to print the universally unique identifier for a
# device; this may be used with UUID= as a more robust way to name devices
# that works even if disks are added and removed. See fstab(5).
#
# <file system> <mount point> <type> <options> <dump> <pass>
# / was on /dev/sda1 during installation
UUID=e7b204f7-9f41-42d4-b55f-292990f4137a / ext4 errors=remount-ro 0 1
# swap was on /dev/sda5 during installation
#UUID=9ca9f4cb-876e-4e23-91a4-2f543b5537ac none swap sw 0 0

```

> reboot

Initialize Master (using Flannel)

> sudo kubeadm init --apiserver-advertise-address <IP ADDRESS> --pod-network-cidr=10.244.0.0/16

```

[init] Using Kubernetes version: v1.13.2
[preflight] Running pre-flight checks
[preflight] Pulling images required for setting up a Kubernetes cluster
[preflight] This might take a minute or two, depending on the speed of your internet connection
[preflight] You can also perform this action in beforehand using 'kubeadm config images pull'
[kubelet-start] Writing kubelet environment file with flags to file "/var/lib/kubelet/kubeadm-flags.env"
[kubelet-start] Writing kubelet configuration to file "/var/lib/kubelet/config.yaml"
[kubelet-start] Activating the kubelet service
[certs] Using certificateDir folder "/etc/kubernetes/pki"
[certs] Generating "ca" certificate and key
[certs] Generating "apiserver-kubelet-client" certificate and key
[certs] Generating "apiserver" certificate and key
[certs] apiserver serving cert is signed for DNS names [deephought kubernetes kubernetes.default kubernetes.default.svc kubernetes.default.svc.cluster.local] and IPs [10.96.0.1 192.168.1.50]
[certs] Generating "front-proxy-ca" certificate and key
[certs] Generating "front-proxy-client" certificate and key
[certs] Generating "etcd/ca" certificate and key
[certs] Generating "etcd/server" certificate and key
[certs] etcd/server serving cert is signed for DNS names [deephought localhost] and IPs [192.168.1.50 127.0.0.1 ::1]
[certs] Generating "etcd/peer" certificate and key
[certs] etcd/peer serving cert is signed for DNS names [deephought localhost] and IPs [192.168.1.50 127.0.0.1 ::1]
[certs] Generating "etcd/healthcheck-client" certificate and key
[certs] Generating "apiserver-etcd-client" certificate and key
[certs] Generating "sa" key and public key
[kubeconfig] Using kubeconfig folder "/etc/kubernetes"
[kubeconfig] Writing "admin.conf" kubeconfig file
[kubeconfig] Writing "kubelet.conf" kubeconfig file
[kubeconfig] Writing "controller-manager.conf" kubeconfig file
[kubeconfig] Writing "scheduler.conf" kubeconfig file
[control-plane] Using manifest folder "/etc/kubernetes/manifests"
[control-plane] Creating static Pod manifest for "kube-apiserver"
[control-plane] Creating static Pod manifest for "kube-controller-manager"
[control-plane] Creating static Pod manifest for "kube-scheduler"
[etcd] Creating static Pod manifest for local etcd in "/etc/kubernetes/manifests"
[wait-control-plane] Waiting for the kubelet to boot up the control plane as static Pods from directory "/etc/kubernetes/manifests". This can take up to 4m0s
[apiclient] All control plane components are healthy after 26.002483 seconds
[uploadconfig] storing the configuration used in ConfigMap "kubeadm-config" in the "kube-system" Namespace
[kubelet] Creating a ConfigMap "kubelet-config-1.13" in namespace kube-system with the configuration for the kubelets in the cluster
[patchnode] Uploading the CRI Socket information "/var/run/docker-shim.sock" to the Node API object "deephought" as an annotation
[mark-control-plane] Marking the node deepthought as control-plane by adding the label "node-role.kubernetes.io/master="
[mark-control-plane] Marking the node deepthought as control-plane by adding the taints [node-role.kubernetes.io/master:NoSchedule]

```

```
[bootstrap-token] Using token: 0s0oa4.2i5lo5vyuyvbnze6
[bootstrap-token] Configuring bootstrap tokens, cluster-info ConfigMap, RBAC Roles
[bootstraptoken] configured RBAC rules to allow Node Bootstrap tokens to post CSRs in order for nodes to get
long term certificate credentials
[bootstraptoken] configured RBAC rules to allow the csrapprover controller automatically approve CSRs from a
Node Bootstrap Token
[bootstraptoken] configured RBAC rules to allow certificate rotation for all node client certificates in the
cluster
[bootstraptoken] creating the "cluster-info" ConfigMap in the "kube-public" namespace
[addons] Applied essential addon: CoreDNS
[addons] Applied essential addon: kube-proxy
```

Your Kubernetes master has initialized successfully!

To start using your cluster, you need to run the following as a regular user:

```
mkdir -p $HOME/.kube
sudo cp -i /etc/kubernetes/admin.conf $HOME/.kube/config
sudo chown $(id -u):$(id -g) $HOME/.kube/config
```

You should now deploy a pod network to the cluster.

Run "kubectl apply -f [podnetwork].yaml" with one of the options listed at:

<https://kubernetes.io/docs/concepts/cluster-administration/addons/>

You can now join any number of machines by running the following on each node as root:

```
kubeadm join 192.168.1.50:6443 --token 0s0oa4.2i5lo5vyuyvbnze6 --discovery-token-ca-cert-hash sha256:
20b8104c05927611df68ebb0eb9fbf8f65d3b85d2e57de9ecc5468e5369b9c22
```

Record the kubeadm join command!

As your non root user:

```
mkdir -p $HOME/.kube
sudo cp -i /etc/kubernetes/admin.conf $HOME/.kube/config
sudo chown $(id -u):$(id -g) $HOME/.kube/config
```

Verify that your network is on the right network interface

```
kubectl get pods -o wide --all-namespaces
```

NAMESPACE	NAME	READY	STATUS	RESTARTS	AGE	IP	NODE
NOMINATED NODE	READINESS GATES						
kube-system	coredns-86c58d9df4-8zk5t	0/1	Pending	0	2d3h	<none>	<none>
<none>	<none>						
kube-system	coredns-86c58d9df4-tsftk	0/1	Pending	0	2d3h	<none>	<none>
<none>	<none>						
kube-system	etcd-k8master	1/1	Running	1	2d3h	10.0.3.15	k8master
<none>	<none>						
kube-system	kube-apiserver-k8master	1/1	Running	1	2d3h	10.0.3.15	k8master
<none>	<none>						
kube-system	kube-controller-manager-k8master	1/1	Running	1	2d3h	10.0.3.15	k8master
<none>	<none>						
kube-system	kube-proxy-88gdq	1/1	Running	1	2d3h	10.0.3.15	k8master
<none>	<none>						
kube-system	kube-scheduler-k8master	1/1	Running	1	2d3h	10.0.3.15	k8master
<none>	<none>						

Install Flannel Network Plugin

```
> sudo sysctl net.bridge.bridge-nf-call-iptables=1
```

```
> kubectl apply -f https://raw.githubusercontent.com/coreos/flannel/bc79dd1505b0c8681e4e44c0d86c5cd2643275/Documentation/kube-flannel.yml
```

NOTE: See <https://kubernetes.io/docs/setup/independent/create-cluster-kubeadm/> for details on the various plugins and their setup.

Verify that all of your kubernetes pods are running

```
> kubectl get pods --all-namespaces
```

NAMESPACE	NAME	READY	STATUS	RESTARTS	AGE
kube-system	coredns-86c58d9df4-8zk5t	1/1	Running	0	47h
kube-system	coredns-86c58d9df4-tsftk	1/1	Running	0	47h
kube-system	etcd-k8master	1/1	Running	1	47h
kube-system	kube-apiserver-k8master	1/1	Running	1	47h
kube-system	kube-controller-manager-k8master	1/1	Running	1	47h
kube-system	kube-flannel-ds-amd64-f15wp	1/1	Running	0	12s
kube-system	kube-proxy-88gdq	1/1	Running	1	47h
kube-system	kube-scheduler-k8master	1/1	Running	1	47h

Enable Scheduling Pods on Master Node

By default, your cluster will not schedule pods on the master for security reasons. If you want to be able to schedule pods on the master, e.g. for a single-machine Kubernetes cluster for development, run:

```
> kubectl taint nodes --all node-role.kubernetes.io/master-
```

Install Dashboard

From the master node:

```
> kubectl create -f https://raw.githubusercontent.com/kubernetes/dashboard/master/aio/deploy/recommended/kubernetes-dashboard.yaml

secret/kubernetes-dashboard-certs created
serviceaccount/kubernetes-dashboard created
role.rbac.authorization.k8s.io/kubernetes-dashboard-minimal created
rolebinding.rbac.authorization.k8s.io/kubernetes-dashboard-minimal created
deployment.apps/kubernetes-dashboard created
service/kubernetes-dashboard created
```

Create a dashboard admin user:

```
vi dashboard-adminuser.yaml
```

Browse to:

<http://localhost:8001/api/v1/namespaces/kube-system/services/https:kubernetes-dashboard:/proxy/>.

Access the Dashboard using port forwarding

From your local machine:

```
> ssh -L 8443:127.0.0.1:8443 <USER>@<IP>
```

```
> kubectl port-forward $(kubectl -n kube-system get pods |grep kubernetes-dashboard |awk '{print $1}') 8443:8443 --namespace=kube-system
```

Browse to:

<https://localhost:8443>

Sign in to the Dashboard

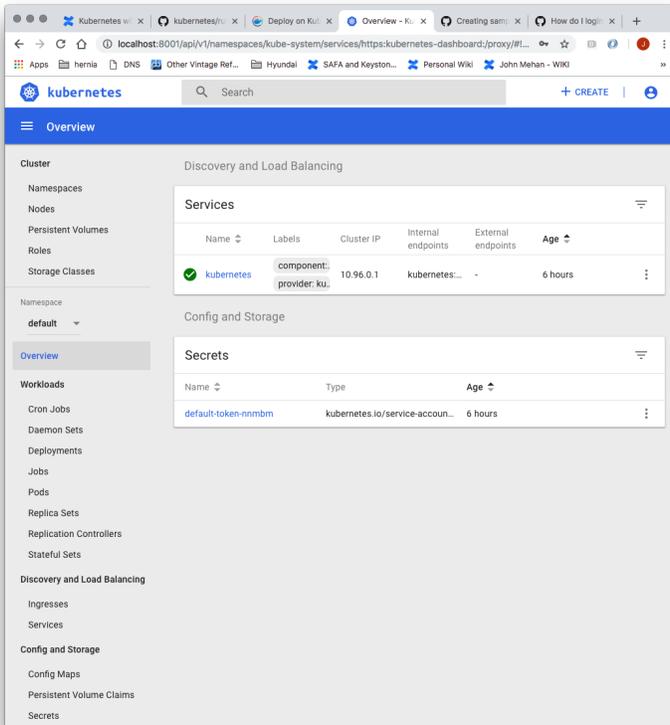

Sign in using the token previously retrieved.

Kubernetes Dashboard

Kubeconfig
Please select the kubeconfig file that you have created to configure access to the cluster. To find out more about how to configure and use kubeconfig file, please refer to the [Configure Access to Multiple Clusters](#) section.

Token
Every Service Account has a Secret with valid Bearer Token that can be used to log in to Dashboard. To find out more about how to configure and use Bearer Tokens, please refer to the [Authentication](#) section.

Enter token
.....

Install Sample Pod

> vi nginx-example.yaml

```
apiVersion: apps/v1 # for versions before 1.9.0 use apps/v1beta2
kind: Deployment
metadata:
  name: nginx-deployment
spec:
  selector:
    matchLabels:
      app: nginx
  replicas: 2 # tells deployment to run 2 pods matching the template
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
        - name: nginx
          image: nginx:1.7.9
          ports:
            - containerPort: 80
```

> kubectl apply -f nginx-example.yaml

Expose your nginx pods via a nodePort

> kubectl expose deployment nginx-deployment --type=NodePort --name=nginx

> kubectl get services

NAME	TYPE	CLUSTER-IP	EXTERNAL-IP	PORT(S)	AGE
kubernetes	ClusterIP	10.96.0.1	<none>	443/TCP	95m
nginx	NodePort	10.98.77.176	<none>	80:31490/TCP	119s

From the above we can see that the nginx service is exposed on port 31490.

Verify by issuing the following command:

```
> curl http://<NODE_IP>:31490
```

Troubleshooting

Reset and start all over

```
> sudo kubeadm reset
```
