Creating an SSH Key

<https://docs.github.com/en/github/authenticating-to-github/generating-a-new-ssh-key-and-adding-it-to-the-ssh-agent>

```
> ssh-keygen -t ed25519 -C "your_email@example.com"
```

... see above link

Adding your SSH key for Login without Password

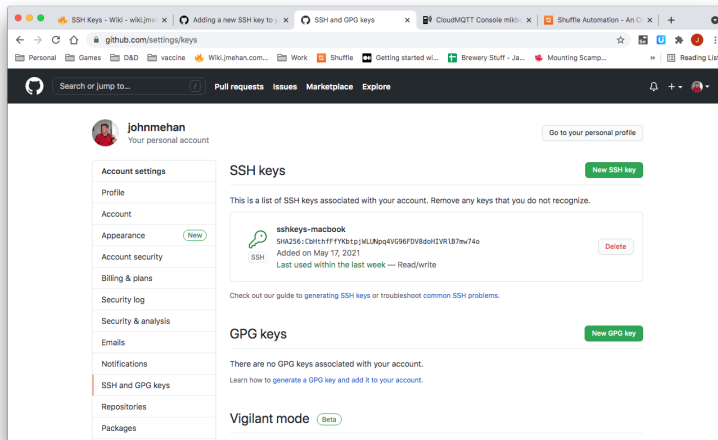

In order to login to another machine over ssh without requiring a password, we can add the public ssh key to the server's list of authorized keys.

For each user:

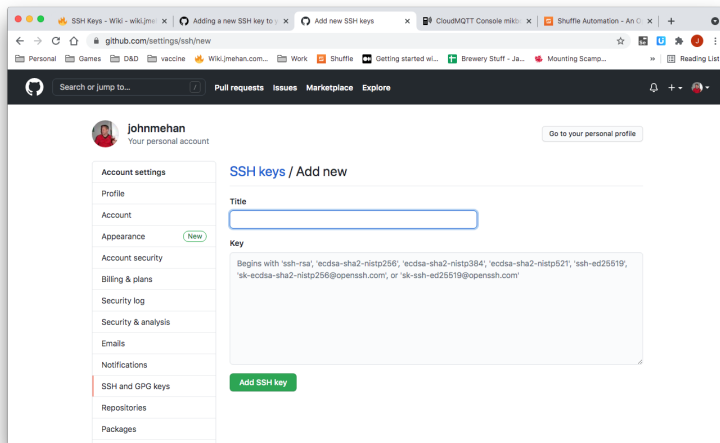

- they should generate (on their local machine) their keypair using `ssh-keygen -t rsa` (the `rsa` can be replaced with `dsa` or `rsa1` too, though those options are not recommended).
- they need to put the contents of their public key (`id_rsa.pub`) into `~/.ssh/authorized_keys` on the server being logged into.

Adding your key to Github

Navigate to Settings SSH and GPG keys. Click New

Give the keys a title and then paste the contents of `~/.ssh/id_ed25519.pub` into the keys input box and click Add SSH Key.
