

Using FFT to Read Frequencies

- [Background](#)

Background

We can combine waves at different frequencies and amplitudes to generate complicated waves.

A Fourier transform takes a complicated looking wave and spits out the individual frequencies that it contains.

Sampling

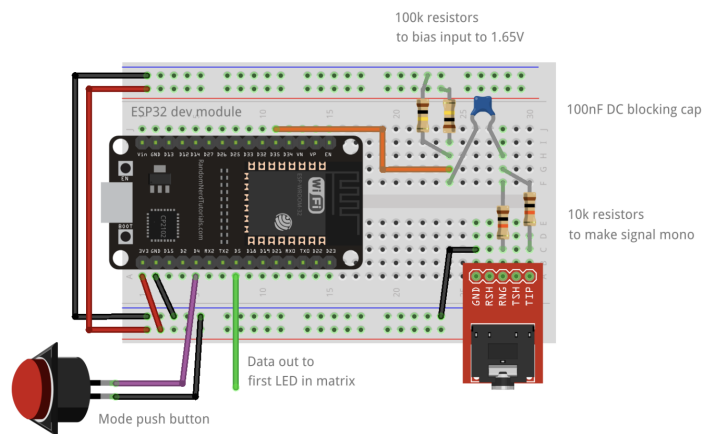

We can sample a wave with a frequency equal to half of our sampling rate. So, if we are sampling at 10,000 Hz, we can sample wave of 5000 Hz.

Nyquist theorem

Input Circuit

Sample Code

Understanding the FFT results

Number of samples: 16
Sampling rate: 40kHz

Only use the first half of the samples

Ignore bin 0, this mainly contains DC and mains hum.

Frequency width of each bin is
sample rate / number of samples, in
this case 2.5kHz.

Size of bin = Sampling Rate/#Samples

```
#include <arduinoFFT.h>
#define AUDIO_IN_PIN    A0
#define SAMPLES          128
#define SAMPLING_FREQ    3200
#define AMPLITUDE        100
#define NUM_BANDS        8
#define NOISE             500           // Used as a crude noise filter, values below this are ignored

unsigned int sampling_period_us;

double vReal[SAMPLES];
double vImag[SAMPLES];
unsigned long newTime;

arduinoFFT FFT = arduinoFFT(vReal, vImag, SAMPLES, SAMPLING_FREQ);

void setup() {
  Serial.begin(115200);
  Serial.println("Reading....");

  sampling_period_us = round(1000000 * (1.0 / SAMPLING_FREQ));
  sampleInput();
}

void loop() {
}

void sampleInput() {

  // Sample the audio pin
  for (int i = 0; i < SAMPLES; i++) {
    newTime = micros();
    vReal[i] = analogRead(AUDIO_IN_PIN);
    vImag[i] = 0;
    while ((micros() - newTime) < sampling_period_us) { /* chill */ }
  }

  // Compute FFT
  FFT.DCRemoval();
  FFT.Windowing(FFT_WIN_TYP_HAMMING, FFT_FORWARD);
  FFT.Compute(FFT_FORWARD);
  FFT.ComplexToMagnitude();

  // binSize = SAMPLING_FREQ / SAMPLES
  // binsize = 3200/128 = 25Hz
```

```

// Analyse FFT results
int biggestFrequency = 0;
int magnitude = 0;
int binsize = SAMPLING_FREQ / SAMPLES;

// Don't use sample 0 and only first SAMPLES/2 are usable.
// Each array element represents a frequency bin and its value the amplitude.

for (int i = 1; i < (SAMPLES/2); i++){
  if (vReal[i] > NOISE) { // Add a crude noise filter
    Serial.print(i);
    Serial.print("[");
    Serial.print((i)*binsize);
    Serial.print("]");
    Serial.print(": ");
    Serial.println((int)vReal[i]);
    if((int)vReal[i] > magnitude){
      biggestFrequency=(i)*binsize;
      magnitude=(int)vReal[i];
    }
  }
}

if(biggestFrequency>0){
  Serial.print("f=");
  Serial.print(biggestFrequency);
  Serial.print(" c=");
  Serial.println(magnitude);
}
}

```
