

Redirect Pizza

When I was trialing confluence in the cloud, I used redirect pizza to redirect wiki.jmehhan.com to jmehhan.atlassian.net.

The screenshot shows the Redirect Pizza web interface in a browser. The browser's address bar shows the URL `redirect.pizza`. The interface has a navigation bar with links for Redirections, Hostnames, Email forwards, Analytics, and More. The main content area is titled "Redirects / Detail" and shows a redirect configuration for `wiki.jmehhan.com`. There are buttons for "Delete redirect" and "Edit redirect". The configuration details include:

- Source URL:** A table with one row:

#	SOURCE URL
1	wiki.jmehhan.com
- Destination URL:** `https://jmehhan.atlassian.net/wiki`
- Redirect type:** Temporary (302)
- Path forwarding:** No
- Query string forwarding:** No
- Tracking:** No
- Notes:** Add
- Last changed:** 5 minutes ago

Below the redirect details is a "Hostnames" section with a table:

DOMAIN	DETECTED	REQUIRED	DNS
wiki.jmehhan.com	89.106.200.1	CNAME / A	edge.redirect.pizza

The bottom of the interface shows the plan as "Free" and a link to "Share the love".
